DO-IT-YOURSELF FAKE ID

With all the technology available at most of the homes, producing a fake ID is a do-it-yourself process now, which make use of the equipments already available with you or can be done at a local outlet. But you should remember that these fake IDs are for having fun, like getting into adult drinking bars or any such clubs where you are not allowed. You should never use the fake IDs for any official or for any purpose that is not legal.

The equipments that you require to make you own fake ID are; a computer that has an image editing software and a scanner to convert your hard copy into digital format. You also need a high quality color printer to print the ID and a machine to laminate the ID. You will also require a few trivial items like a razor, a pot for boiling water, a tweezers to give the final touch.

To start the process you will require an old legal laminated ID card similar to the one you are going to create. Scan each of the sides of this old ID on the scanner using a high resolution format; if you don't have a scanner get it scanned from a computer store. By using a photo editor, preferably Photoshop, you import the scanned ID and edit the file. Make all the necessary changes. While making changes you should keep in mind to use the same fonts that are there in the old ID. You should pay special attention to the issue date and the expiry date of the ID card; it is a small detail that you might overlook, but very important one. If the validity of the card is four years, you should maintain that in your creation. After you have done all the alteration print it in such a way that the color and size is identical to the original one.

Now the tricky part comes; the lamination of the fake card. You have to use the original lamination from the old ID as it contains the stamp of authority. With the help of a razor carefully split open the lamination in such a way that you do not destroy it. Try to pry out the old card with tweezers. If you find it tricky, boil some water in a pan and boil the lamination for about half an hour. If you still find some pieces left of the old ID, use the tweezers to pry them out; if you are unable to do so, boil the lamination again. When you have cleaned the lamination, dry it and place you fake ID between the sides of the lamination, after cutting it in the required size. Now you laminate it with the use of a lamination machine, if you don't have one, get it done from outside.

It might so happen that you do not possess most of the equipment at home; you can then get it done from outside. Although in order to be on the safer side, it is better to have equipment at home as you do not want to risk the shop attendants notice that you are up to something fishy.
