

## **Make Fake Your ID**

Boys and girls who are below 21 years old, this is for you. Here it is your chance to have your very own fake ID. Yes, the ticket to booze and all night bar hopping, the gateway to liquor stores. You can (1) [have your very own fake ID](#) by following this do-it-yourself. No more worries about buying fake IDs from scam websites. You control the production process so it is up to you how you want it done and even how many fake IDs you want.

Making your own fake ID is very easy. But you will need some items in order to do so. First you will need a computer with an image editor. You will also need a scanner in order to digitize the hard copies to your computer. You will also need good quality color printer for printing the ID paper and a laminating machine to finalize the ID. Other small items for the finishing touches include tweezers, a razor and a pot. Most of the things you need are either easy to get or you already have.

Now for the actual steps in making a fake ID. First you will need an old fashioned laminated driver's license or ID card, better if it is one with your picture and name on it already. An older version of the Washington Stated ID or a similar ID card will work well for this example. As soon as you have one, scan it with your flat-bed scanner at a fairly good resolution. If you do not have a scanner at home, there are plenty of computer stores that will allow you to have it scanned for a fair price. Scan both sides of the ID as you will need a copy of them. Then open the scanned files in your photo editor software. We recommend Photoshop but any photo image editing software will do.

Edit the information on the ID that will make it valid as your ID and also make you 21 years old. To do this, you just erase the text you need to edit then type in the new text. Be sure to use the font type and size nearest to the other text in the ID you did not change and make sure the information you edit are consistent with all the information on the ID. For instance, before editing date of issue and expiration, check the period between the two dates. If it is 4 years then be sure that the new dates you put in are consistent with the 4 year expiration of the ID.

As soon as you have checked all that all the information on the front and back side of your edited ID are correct, meaning how you want them, and consistent, print the photos with your color printer. Make sure the size and color of your print out matches perfectly with the original ID. Again, if you do not have a printer, have it printed at a computer store. When you get the perfect print outs, cut it to size and just set aside for now as you start work on the lamination.

Now get your original old ID and with a razor blade, split the laminated sides of the ID in half. Start by nicking the edge of one corner with the razor and as soon as it splits work slowly until you get it all off. Do not tear that plastic, keep and remove any cardboard left from the two sides but do not worry if you cannot get all of it. Drop the two pieces of plastic in a pan of boiling water and leave it for 20-30 minutes. After taking it out of the boiling water, remove any excess paper. If there is still an impression of the original photo on the front side of the plastic, pull the impression off from the inner side with a pair of tweezers. It should peel off easily after boiling. If it does not, put it back in the boiling water then try again.

Now you have two clean sides of your ID still with the gold stripping or logo intact. Get your newly printed and cut ID and place the copies between the two sides and laminate again. If you do not have a laminating machine you could try to do it outside, just be sure you know that the place will allow it as some places might put you hot on the trail of the police. Or you could just buy your own inexpensive laminator. That is it. The next step is to (2) [test your new fake ID](#), and hope the bartender has bad eyesight.
